PROCESS FOR THE PREPARATION OF 7-SUBSTITUTED-3-QUINOLINE AND 3-QUINOL-4-ONE
CARBONITRILES

5

BACKGROUND OF THE INVENTION

This invention relates to a process for the preparation of 7-substituted-3-quinolinecarbonitriles and intermediates useful in a process to prepare 7-substituted-3-quinolinecarbonitriles and pharmaceutically acceptable salts thereof.

Protein kinases are enzymes that catalyze the transfer of a phosphate group
10 from ATP to an amino acid residue, such as tyrosine, serine, threonine, or histidine on a protein. Regulation of these protein kinases is essential for the control of a wide variety of cellular events including proliferation and migration. Specific protein kinases have been implicated in diverse conditions including cancer [Traxler, P. M., Exp. Opin. Ther. Patents, 8, 1599 (1998); Bridges, A. J., Emerging Drugs, 3, 279
15 (1998)], restenosis [Mattsson, E., Trends Cardiovas. Med. 5, 200 (1995); Shaw, Trends Pharmacol. Sci. 16, 401 (1995)], atherosclerosis [Raines, E. W., Bioessays, 18, 271 (1996)], angiogenesis [Shawver, L. K., Drug Discovery Today, 2, 50 (1997); Folkman, J., Nature Medicine, 1, 27 (1995)] and osteoporosis [Boyce, J. Clin. Invest., 90, 1622 (1992)] and stroke (Paul, R. et al, Nature Medicine, 7(2), 222(2001). An
20 effective preparation of compounds which are inhibitors of protein tyrosine kinases and are useful in the treatment of cancer is important.

The compounds disclosed in WO9843960 (US 6,002,008) are 3-quinolinecarbonitrile derivatives which are inhibitors of protein tyrosine kinases and useful in the treatment of cancer. The aforementioned compounds have been
25 prepared by processes which are effective for the initial preparation of targeted compounds. However, a new and effective alternate source of important intermediates useful in the preparation of 3-quinolinecarbonitrile derivatives is desired. Additionally desired is an alternate process to prepare 7-substituted-3-quinolinecarbonitriles.

30 A further series of new 3-quinolinecarbonitriles which are also highly effective inhibitors of protein tyrosine kinases and useful in the treatment of cancer are disclosed in published application WO 00/18740. Suitable processes for the

preparation of 3-quinolinecarbonitriles are described therein, however, there is still a need in the art for yet more suitable methods for the preparation of important intermediates and final products useful in the preparation of 3-quinolinecarbonitriles useful in the treatment of cancer.

5 Therefore, methods to prepare 7-substituted-3-quinolinecarbonitriles and intermediates to facilitate their preparation are of great value.

It is an object of this invention to provide an alternate process to prepare 7-substituted-3-quinolinecarbonitriles and intermediates useful in a process to prepare 7-substituted-3-quinolinecarbonitriles which are highly effective as inhibitors of
10 protein kinases useful in the treatment of cancer.

It is an object of this invention to provide a novel process for the preparation of 7-substituted-3-quinolinecarbonitriles by displacement of the 7-fluoro group of 7-fluoro-4-(substituted amino)quinolinecarbonitriles.

It is a further object of this invention to provide a novel process for the
15 preparation of 7-substituted-4-oxo-1,4-dihydro-3-quinolinecarbonitriles by displacement of the 7-fluoro group of 7-fluoro-4-oxo-1,4-dihydro-3-quinolinecarbonitriles.

DETAILED DESCRIPTION OF THE INVENTION

The process of the present invention is illustrated in the following reaction schemes. The routes for the preparation of 7-substituted-3-quinolinecarbonitriles of this invention encompassed by Formula (I) is described as follows starting with Scheme 1. 7-Fluoro-4-oxo-1,4-dihydro-3-quinolinecarbonitriles of Formula (II) where W' is -H or -OR³ are converted to 7-fluoro-3-quinolinecarbonitriles 1 wherein Z is a chloro or bromo group by treatment with a halogenating reagent which includes but is not limited to phosphorous oxychloride and phosphorous oxybromide either neat or optionally in the presence of a cosolvent which includes but is not limited to dichloromethane. Reaction of 7-fluoro-3-quinolinecarbonitrile 1 with an amine R¹NH₂ 1a wherein R¹ is as hereinbefore defined may be carried out in a solvent such as 2-ethoxyethanol in the presence of a catalytic or equivalent amount of pyridine hydrochloride results in the formation of intermediate 7-fluoro-4-(substituted amino)-3-quinolinecarbonitriles 2 where W' is hereinbefore defined. Preferably, amine R¹NH₂ 1a is a substituted aniline where R¹ is substituted aryl. Displacement of the 7-fluoro group of 7-fluoro-4-(substituted amino)-3-quinolinecarbonitriles 2 with an alkoxide or thioalkoxide anion results in the preparation of 7-substituted-3-quinolinecarbonitriles of Formula (I). This reaction can be performed using an excess of the alcohol R²OH or thiol R²SH as the solvent or an optional cosolvent such as N,N-dimethylformamide, dimethyl sulfoxide or N-methylpyrrolidone can be used. The anion can be generated from the alcohol or thiol 2a where X is O or S by the use of a base. Suitable bases include sodium, sodium hydride, potassium and potassium hydride. Preferred bases are sodium and sodium hydride. Commercially available sodium salts of the alcohol or thiol 2a where X is O or S are used if available. Reaction of a compound of the formula R²XH 2a, where X is -NH-, -NR²- and where

R^2 and R^2 may optionally be taken together with the nitrogen to which they are attached to form a heterocyclic ring, affords 7-substituted-3-quinolinecarbonitriles of Formula (I).

An alternative route to 7-substituted-3-quinolinecarbonitriles of Formula (I) is described in Scheme 2. 7-Fluoro-4-oxo-1,4-dihydro-3-quinolinecarbonitriles of Formula (II) where W' is hereinbefore defined are converted to 7-substituted-4-oxo-1,4-dihydro-3-quinolinecarbonitriles 3 by replacement of the 7-fluoro group with an
 15 alkoxide or thioalkoxide anion. This reaction can be performed using an excess of the alcohol or thiol as the solvent or optionally a cosolvent such as N,N-dimethylformamide, dimethyl sulfoxide or N-methylpyrrolidone may be used. The anion may be generated from the alcohol or thiol 2a where X is O or S respectively by the use of a base. Suitable bases include sodium, sodium hydride, potassium and
 20 potassium hydride. Preferred bases are sodium and sodium hydride. Commercially available sodium salts of the alcohol or thiol 2a where X is O or S are used if available. Reaction of 7-fluoro-4-oxo-1,4-dihydro-3-quinolinecarbonitriles of Formula (II) with a compound of the formula R²XH 2a, where X is -NH-, -NR²- and where R² and R² may optionally be taken together with the nitrogen to which they are attached
 25 to form a heterocyclic ring, to afford 7-substituted-4-oxo-1,4-dihydro-3-quinolinecarbonitriles 3. Treatment of 7-substituted-4-oxo-1,4-dihydro-3-quinolinecarbonitriles 3 with a halogenating reagent PO(Z)₃ wherein Z is a chloro or bromo group which include but not limited to phosphorous oxychloride, phosphorous oxybromide either neat or optionally in the presence of a cosolvent which include but

not limited to dichloromethane affords 7-substituted-4-halo-3-quinolinecarbonitriles 4 which are further reacted with an amine 1a wherein R^1 is as hereinbefore defined in a solvent such as 2-ethoxyethanol in the presence of a catalytic or equivalent amount of pyridine hydrochloride results in the formation of 7-substituted-3-quinolinecarbonitriles of Formula (I). Preferably amine R^1NH_2 1a is a substituted aniline where R^1 is substituted aryl.

Scheme 2

A preferred compound of formula (I) prepared by the process of the present invention is:

- 10 4-[(2,4-Dichlorophenyl)amino]-7-(2-methoxyethoxy)quinoline-3-carbonitrile;
- 6-Butoxy-4-[(2,4-dichloro-5-methoxyphenyl)amino]-7-(2-methoxyethoxy)-3-quinolinecarbonitrile;
- 6-Methoxy-7-(4-methylpiperazin-1-yl)-4-(4-phenoxyphenylamino)-quinoline-3-carbonitrile; and
- 15 6-Methoxy-7-(1-methyl-piperidin-4-ylmethoxy)-4-[[4-(pyridin-3-yloxy)-phenyl]amino}quinoline-3-carbonitrile

A preferred compound of formula 3 prepared by the process of the present invention is selected from the group consisting of:

6-Methoxy-7-(2-methoxyethoxy)-4-oxo-1,4,-dihydro-3-quinolinecarbonitrile;

6-Methoxy-7-(4-methyl-piperazin-1-yl)-4-oxo-1,4-dihydroquinoline-3-carbonitrile; and

5 7-(2-Methoxyethoxy)-4-oxo-1,4-dihydroquinoline-3-carbonitrile.

An alternative approach, as shown in Scheme 3, for the preparation of 7-substituted-3-quinolinecarbonitriles of Formula (I) uses a protecting group of the hydroxy group at C-6 of the 3-quinolinecarbonitrile 5. The protecting group is designated $R^{3'}$ and includes but is not limited to groups including benzyl and isopropyl which may be removed to provide the 6-hydroxy derivative 6. Specifically,
 10 if $R^{3'}$ is a benzyl protecting group, the desired hydroxy group can be obtained by treatment with trifluoroacetic acid in the presence of thioanisole. Further, if $R^{3'}$ is an isopropyl protecting group, the desired 6-hydroxy derivative 6 may be obtained by treatment with aluminum trichloride. Further reaction of 6-hydroxy derivative 6 with
 15 an alcohol R^3OH 6a in the presence of triphenyl phosphine (Ph_3P) where Ph is phenyl and diethylazodicarboxylate (DEAD), in a solvent such as tetrahydrofuran affords 4-halo-3-quinolinecarbonitriles 7.

Scheme 3

Additional intermediates may be prepared as shown in Scheme 4 where 4-halo-3-quinolinecarbonitriles 8 with R^2 and $R^{3'}$ as hereinbefore defined are deprotected to afford 6-hydroxyquinolines 9 using conditions as defined for deprotection in Scheme 3. Further reaction of 6-hydroxy derivatives 9 with an alcohol R^3OH 6a in the

presence of triphenyl phosphine (Ph_3P) where Ph is phenyl, and diethylazodicarboxylate (DEAD), in a solvent such as tetrahydrofuran affords 4-halo-3-quinolinecarbonitriles 10 which may be further reacted with an amine R^1NH_2 1a to afford 7-substituted-3-quinolinecarbonitriles 11. Preferably amine R^1NH_2 1a is a substituted aniline where R^1 is substituted aryl.

Scheme 4

The 7-substituted-4-oxo-1,4-dihydro-3-quinolinecarbonitriles 3 and 7-substituted-4-halo-3-quinolinecarbonitriles 4 are key intermediates used to prepare 7-substituted-3-quinolinecarbonitriles of Formula (I). Scheme 5 shows two alternate routes for the

preparation of additional key intermediates, 7-fluoro-4-oxo-1,4-dihydro-3-quinolinecarbonitriles of Formula (II). Anilines 12 may be treated with ethyl (ethoxymethylene)cyanoacetate either neat or optionally in the presence of a cosolvent such as toluene, at temperatures ranging from about 60 to about 120°C

5 followed by subsequent thermal cyclization, preferably in a eutectic solvent system which includes a 3: 1 mixture of diphenyl ether (Ph-O-Ph) and biphenyl(Ph-Ph) at a temperature range of about 240° to about 260°, affords 7-fluoro-4-oxo-1,4-dihydro-3-quinolinecarbonitriles of Formula (II). Alternatively, aniline 12 is reacted with diethyl (ethoxymethylene)malonate either neat or optionally in the presence of a cosolvent

10 toluene, at temperatures ranging from about 60 to about 120°C. Subsequent thermal cyclization, preferably in a eutectic solvent system which includes 3: 1 mixture of diphenyl ether and biphenyl at elevated temperature, at a temperature range of about 240° to about 260°C, provides ester 13. Hydrolysis of the ester 13 under preferably basic conditions, such as sodium hydroxide in an alcoholic solvent such as ethanol,

15 at reflux temperatures results in carboxylic acid 14. Conversion of carboxylic acid 14 to primary amide 15 may be accomplished by treatment with an activating agent which includes N,N-carbonyl diimidazole(CDI) or oxalyl chloride followed by the addition of either ammonia gas or preferably an aqueous solution of ammonium hydroxide. Dehydration of primary amide 15 with a reagent such as cyanuric

20 chloride in a solvent such as N,N-dimethylformamide provides 7-fluoro-4-oxo-1,4-dihydro-3-quinolinecarbonitriles of Formula (II).

Scheme 5

Alternatively compounds of Formula (II) may be prepared as shown in Scheme 6 from the corresponding anthranilic acid or ester 16 where R¹⁰ is H or alkyl of 1 to 6 carbon atoms by reaction with N,N-dimethylformamide dimethyl acetal or preferably with N,N-dimethylformamide diethylacetal, optionally in the presence of a cosolvent toluene at about 100-130°C to provide amidine 17. Reaction of the anion of acetonitrile, preferably generated from the reaction of n-butyl lithium with acetonitrile, in an inert solvent such as tetrahydrofuran at about -78°C, with amidine 17 provides compounds of Formula (II).

Scheme 6

The compounds of this invention are prepared from: (a) commercially available starting materials (b) known starting materials which can be prepared as described in literature procedures or (c) new intermediates described in the schemes and experimental procedures herein.

Reactions are performed in a solvent appropriate to the reagents and materials employed and suitable for the transformation being effected. It is understood by those skilled in the art of organic synthesis that the various functionalities present on the molecule must be consistent with the chemical transformations proposed. This may necessitate judgement as to the order of synthetic steps, protecting groups, if required, and deprotection conditions. Substituents on the starting materials may be incompatible with some of the reaction conditions. Such restrictions to the substituents which are compatible with the reaction conditions will be apparent to one skilled in the art. Reactions are run under inert atmospheres where appropriate.

The pharmaceutically acceptable salts are those derived from such organic and inorganic acids as: acetic, lactic, citric, tartaric, succinic, maleic, malonic, gluconic, hydrochloric, hydrobromic, phosphoric, nitric, sulfuric, methanesulfonic and similarly known acceptable acids.
